Generic Work Center Request — Readable Breakdown

A plain-language map of the real specification. **This file is a guide, not the specification.** The specification is spec.md in this folder; every decision, requirement and acceptance test lives there. Use this page to find the right part of spec.md fast, and to tell me what to change.

Line references below point into spec.md as it stands today (305 lines). When I change the spec, I update this file's references in the same pass, so a stale line number is a bug — say so.

The idea in one paragraph

Some work centers do not run against a work order. Today the request wizard reads an active setup job to
learn what a request is for; at a generic work center there is nothing to read, so the requester states it themselves. Everything they state must be provable — a part is proved against the WIP floor's records or
against Infor Visual, dunnage comes from the real dunnage catalogue, a die is found by searching Visual, and
a scrap type comes from the plant's own scrap-type list. The result is a normal waitlist request on the normal board, drawn with its own card because a work-order card would be full of cells that do not apply.

The eight user stories

#	Plain language	Priority	Where in spec.md
1	A work center with no job can still raise a request. The requester answers instead of the job.	P1	lines 12-29
2	A stated part is proved real. Ask WIP or finished good first, then autocomplete, then prove against that one system. No stock warns but never blocks.	P1	lines 31-51

#	Plain language	Priority	Where in spec.md
3	Dunnage is picked from the real dunnage catalogue, shown as a wizard page instead of a dialog. One part per request.	P1	lines 53-69
4	Scrap: the requester names the scrap type, from the plant's scrap-type list. The card resolves the lugger from the arrangement.	P2	lines 71-88
5	Die: a search page taking an FGT number or a part number, listing every die the part has with its location. Several dies means several requests.	P2	lines 90-108
6	Time comes from the item's configured allotted minutes — never from a job, never invented, blank when unset.	P2	lines 110-124
7	The generic card: part number plus requesting work center as identity, no work-order cells, distinguishable on the board at a glance.	P2	lines 126-144
8	The generic flag is maintained on the work center catalog by a permitted person. Not hard-coded.	P3	lines 146-162

Edge cases (one line each, all of them real failure modes): lines 164-175.

The requirements, grouped the way the spec groups them

Theme	Requirements	Plain statement	Where in spec.md
Marking a work center generic	FR-001 … FR-003	A per-work-center flag, editable only by whoever already governs the catalog, never a built-in default list.	lines 183-185

Theme	Requirements	Plain statement	Where in spec.md
The generic flow itself	FR-004 … FR-010	Continue without a job, offer the same categories and items, ask instead of read, store and show no work order, land in the same queue, built as its own flow so the work-order flow is untouched.	lines 189-195
Proving a stated part	FR-011 … FR-019	WIP-or-finished-good first, autocomplete only, prove against the chosen system only, refuse unknown numbers, warn on no stock and still allow, report an unreachable source with a retry, store no quantity.	lines 199-207
Dunnage	FR-020 … FR-024	The dunnage step is the catalogue as a page, one part, leaving without choosing records nothing, an unreadable catalogue is reported not faked.	lines 211-215
Scrap	FR-025 … FR-031	Requester states the type, choices come from the plant's one scrap-type list, the card resolves the lugger from the arrangement, a missing assignment is recorded as a gap.	lines 219-225
Die	FR-032 … FR-038	FGT-or-part-number search, Visual is the authority, every die listed with its location, one request per chosen die, unknown die refused, unreachable Visual reported.	lines 229-235
Time, urgency, description	FR-039 … FR-042	Same configured minutes as the work-order request, no default when unset, a needed-by answer that travels to the card, an optional description.	lines 239-242
Confirmation, queue, record	FR-043 … FR-047	Review lists everything about to be raised, one write into the queue, the requester's real identity, the accepted warnings kept, existing handler flow.	lines 246-250

Theme	Requirements	Plain statement	Where in spec.md
Cards and detail	FR-048 … FR-053	Own layout, part plus work center identity, only facts that exist, distinguishable on one list, detail page adds requester and history.	lines 254-259
Truthfulness (applies to all of the above)	FR-054 … FR-055	Every value is a real read, the requester's answer, or configuration — and every failure is reported where it happens, not swallowed.	lines 263-264

What the generic card shows

Shown	Rule	Where in spec.md
Category and item wording	Same wording the work-order cards use	FR-050
Part number	The stated part, proved against WIP or Visual	FR-049, FR-011-013
Work center	The request's identity alongside the part	FR-049
Needed-by time	The requester's answer	FR-041
Scrap type and lugger	Only on scrap requests; lugger from the arrangement	FR-028
Dunnage part	Only on dunnage requests	FR-021
Everything else	Absent, never blank or placeholder	FR-048, FR-052

Change map — tell me what changed, and this is what I edit

If you change your mind about…	I edit in spec.md
Whether a work center is generic (flag vs. list vs. automatic)	FR-001 to FR-003 and User Story 8
Whether the wizard still reads an active job at a generic work center	FR-004, FR-006, A9, Q1
Which answers the requester gives instead of the job	FR-006 and User Stories 2-5
The WIP vs. finished-good question, or which system proves the part	FR-011 to FR-019 and User Story 2
Whether a part with no stock may still be requested	FR-017, SC-006
Whether a quantity is ever captured	FR-019, A4, Q2
How dunnage is chosen, or how many parts one request carries	FR-020 to FR-024, A6
Where scrap types come from	FR-025 to FR-031, A7
How the lugger is decided on a scrap card	FR-028, FR-029
How a die is found, or what a search returns	FR-032 to FR-038 and User Story 5
Whether several dies mean several requests	FR-036, A5
Where the time estimate comes from	FR-039 to FR-040, User Story 6
What the requester is asked for besides the part	FR-041 to FR-042, User Story 6
What the card shows, or how generic and work-order cards are told apart	FR-048 to FR-053 and User Story 7
Where generic requests land (same queue, own board)	FR-008, A3
Who may mark a work center generic	FR-002

If you change your mind about…	I edit in spec.md
How the flow is packaged as projects/modules	FR-009
Any measurable outcome or success bar	SC-001 to SC-008
A behaviour that should never be faked or guessed	FR-054 to FR-055

Where the facts behind the design came from

Not requirements — the existing code the spec leans on, so a change knows what it is changing away from.

Claim in the spec	What backs it today
Work-order requests read an active setup job	`MTM_Waitlist.Waitlist.NewRequest` flow rules and the job availability provider behind the wizard.
Part stock can be read and does not invent a number	`IPartStockService` and the part stock window the Deliver Component card already opens.
WIP floor holds its own inventory records	`WipFloorInventoryService` against `mtm_wip_application_winforms`.
A dunnage catalogue with pictures already exists	`IDunnageSubstitutePicker` and the substitute picker the dunnage step already calls.
One scrap-type list is already shared	`ScrapTypeCatalog` in `MTM_Waitlist.Core`, used by the Setup picker and the lugger arrangement editor.
The lugger arrangement already decides a dump point	Spec 013's arrangement tables and the transition rules on the scrap card.
A die is a Visual `FGT` part with a home location	The Visual subordinate-parts read, which classifies `FGT` as a die and resolves a die's location from its primary location.
Several dies already mean several requests	The existing wizard's one-request-per-die behaviour.
Time already comes from configured allotted minutes	The request item configuration's allotted minutes.

Claim in the spec	What backs it today
Parts can be searched live in Visual	The existing part-match search, which is deliberately live-only with no cached mirror.

Still open

- **Q1** — may a generic work center ever read an active job on purpose? Currently assumed never. line 304
- **Q2** — is the requesting work center always where a stated part should go? Currently assumed yes. line 305
